1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Jaerisch et al (US 3,858,981) and Pike (US 5,311,286) in view of Hamada et al (US 4,972,075).

Both Jaerisch et al and Pike show measuring variation in depth of a surface by observing the moire fringes produced when the surface is illuminated and viewed through a grating. Jaerisch et al notes that the pitch of the grating can be small enough to produce diffraction, and that the spacing of the grating and the surface then should be adjusted to a proper distance. In the moire-based measuring art it is known that the Talbot distance is a distance that produces this recognized result, as taught by Hamada et al, see in particular column 3, lines 33-36, which teaches that at the Talbot distance a sharp image of the grating, and thus sharp moire fringes, is formed. Thus it would have been obvious to place the grating in arrangements such as shown by Jaerisch et al and Pike at the Talbot distance to achieve this art-recognized benefit of a sharp image of the grating and a sharp

moire pattern. Pike teaches a formula for determining the contour interval (see equation (2), column 6, line 63).
